TABLE 3
PROVINCIAL AVERAGES OF POLICY AND WEATHER VARIABLES, 1952–77

Year	Steel and Iron Output (10,000 Tons) (1)	Retained Grain per Capita in Rural Areas (kg/Person) (2)	Weather Conditions* (3)	% Provinces That Removed Exit Rights (4)	Size of Production Units (Households) (5)
1952	4.8	289			
1953	6.3	282			
1954	7.9	251	3.33	20	22
1955	10.2	271	2.58	20	33
1956	16.0	306	3.17	44	162
1957	19.1	257	3.42	60	179
1958	30.4	280	2.71	60	2,675
1959	46.9	210	3.54	64	1,696
1960	62.6	179	4.00	64	1,751
1961	31.0	186	3.95	64	354
1962	23.8	214	3.39	64	41
1963	27.2	230	3.09	64	30
1964	34.4	244	2.70	64	31
1965	43.7	278	2.74	64	33
1966	54.7	284	2.58	68	31
1967	36.8	289	2.58	68	31
1968	32.6	260	2.83	72	35
1969	47.5	249	2.83	72	36
1970	63.3	278	2.70	68	37
1971	76.0	297	3.13	68	49
1972	83.5	276	3.41	68	50
1973	90.0	293	2.83	68	39
1974	72.2	314	2.48	68	40
1975	85.4	314	2.91	68	40
1976	73.1	300	3.00	68	41
1977	84.8	296	2.87	64	42
Number of provinces	25	19	25	25	23

SOURCE.—Data in cols. 1 and 2 are taken from published sources, and data in cols. 3–5 are taken from the retrospective survey that covers the years between 1954 and 1977. Availability of data varies across provinces.

NOTE.—The last row shows the maximum number of provinces for which data are available for each of the variables for the entire sample period.

* 1 = very good, 3 = average, and 5 = very bad.

consumption directly, we do have data on procurement for each province in each year. Since grain consumed during the current planting season must come from retained grain (total grain output minus total procurement) from previous harvesting seasons, we use lagged values of retained grain as a measure of availability of food for the current year. Between 1959 and 1961, as column 2 of table 3 reveals, the retained grain per capita plunged to its lowest levels as a result of production declines and excessive procurement.

Weather.—We obtained from our survey an index of annual weather conditions for each province on a scale from 1 to 5, with 1 being very
